

Hazard Briefing

TODAY'S POSTURE

Today is dominated by a heat wave onset, with a peak heat index of 104°F and NYCEM Heat Event criteria met; a Marginal severe convective risk and Moderate air quality (peak AQI 100, O3/PM2.5) are also active today at low severity.

EXTENDED OUTLOOK – NEXT 7 DAYS

Heat — Heat wave begins today — first day meeting heat index ≥100°; peak heat index 104° today in Queens. Heat Emergency Plan triggers expected.

How the AFD is trending

Wed 4:10 AM ET

SEVERE • EXCESSIVE HEAT • HEAT IDX 100 • SMALL CRAFT

1) Hot conditions expected today with heat indices near 100F in many areas. There remains a marginal severe thunderstorm threat late this afternoon into early this evening. Areas of wildfire smoke may also lead to hazy skies and reduced visibilities at times. 2) Unsettled conditions expected at times this weekend into early next week, with chances for showers and thunderstorms. 3) High risk of rip currents at local ocean beaches today (see Marine discussion).

Tue 2:48 PM ET

EXCESSIVE HEAT • SMALL CRAFT • SEAS 6 FT

1) Hot and humid conditions continue through at least Wednesday. However, temperatures may be limited by wildfire smoke from Canada. 2) Unsettled conditions expected this weekend into early next week with showers and thunderstorms. 3) High risk of rip currents today into Wednesday, particularly through Wednesday morning (see Marine discussion).

Tue 6:52 AM ET

EXCESSIVE HEAT • HEAT IDX 95 • SMALL CRAFT • SEAS 6 FT

1) Hot and humid conditions expected today and Wednesday. 2) Seasonable warmth returns late this week into the weekend. A frontal system brings our next chance for showers and thunderstorms this weekend. 3) High risk of rip currents today into Wednesday, particularly late this afternoon through Wednesday morning (see Marine discussion).

Tue 3:58 AM ET

EXCESSIVE HEAT • HEAT IDX 95 • SMALL CRAFT • SEAS 6 FT

1) Hot and humid conditions expected today and Wednesday. 2) Seasonable warmth returns late this week into the weekend. A frontal system brings our next chance for showers and thunderstorms this weekend. 3) High risk of rip currents today into Wednesday, particularly late this afternoon through Wednesday morning (see marine discussion).

Tue 2:11 AM ET

EXCESSIVE HEAT • HEAT IDX 95 • SMALL CRAFT

1) Hot and humid conditions expected Today and Wednesday. 2) Seasonable warmth returns late this week into the weekend. A frontal system brings our next chance for showers and thunderstorms this weekend. 3) High risk of rip currents Today, particularly late this afternoon and evening (see marine discussion).

NWS Hazardous Weather Outlook

For southern Connecticut, northeast New Jersey and southeast New York

TODAY

Today and tonight.

Please listen to NOAA Weather Radio or go to weather.gov on the Internet for more information about the following hazards.

Heat Advisory.

DAYS 2-7

Thursday through Tuesday.

No hazardous weather is expected at this time that would meet NWS warning criteria.

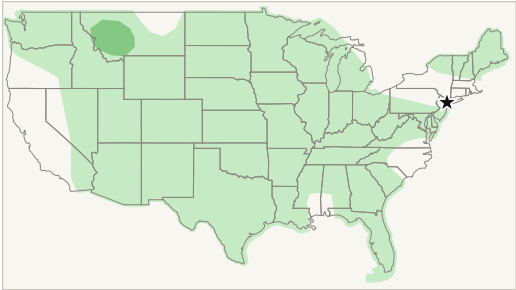

SPOTTER INFORMATION

Spotter activation is not expected at this time.

Severe Weather Outlook — SPC

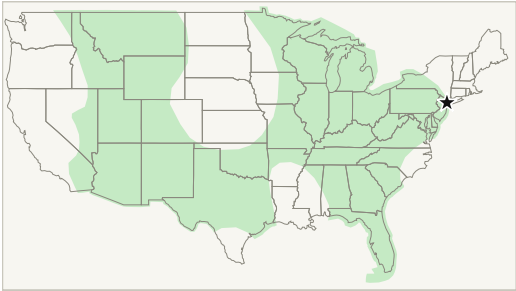

DAY 1 — TODAY (Jul 15)

DAY 2 — TOMORROW (Jul 16)

NYC: No thunderstorms forecast

DAY 3 — FRIDAY (Jul 17)

NYC: General T'storms

NYC: Marginal (1/5)

LEGEND — OFFICIAL NWS DEFINITIONS

TSTM General thunderstorms — severe storms not expected	MRGL Marginal (1/5) — isolated severe storms possible; limited duration, coverage, intensity
SLGT Slight (2/5) — scattered severe storms possible; short-lived, not widespread	ENH Enhanced (3/5) — numerous severe storms possible; more persistent / widespread
MDT Moderate (4/5) — widespread severe storms likely; long-lived, some intense	HIGH High (5/5) — severe weather outbreak expected; very widespread, particularly intense

DAY 1 DISCUSSION — SPC REGIONAL (verbatim excerpt)

...THERE IS A MARGINAL RISK OF SEVERE THUNDERSTORMS ACROSS PARTS OF NEW ENGLAND...THE MID-ATLANTIC...NORTHERN ROCKIES...AND ARIZONA...

DAY 2 DISCUSSION — SPC REGIONAL (verbatim excerpt)

An expansive mid-level ridge will remain in place across much of the CONUS on Thursday. On the western side of the ridge, a closed mid-level low will lift northward, helping to raise mid-level heights northward into Canada. On the eastern side of the ridge, a strong mid-level trough will move across New England, within the ...

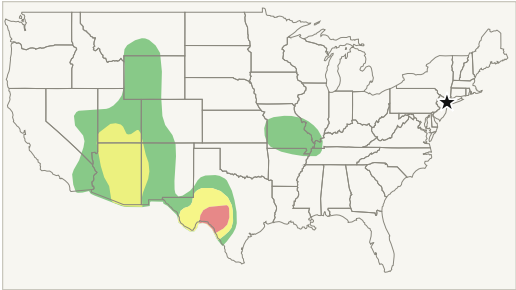

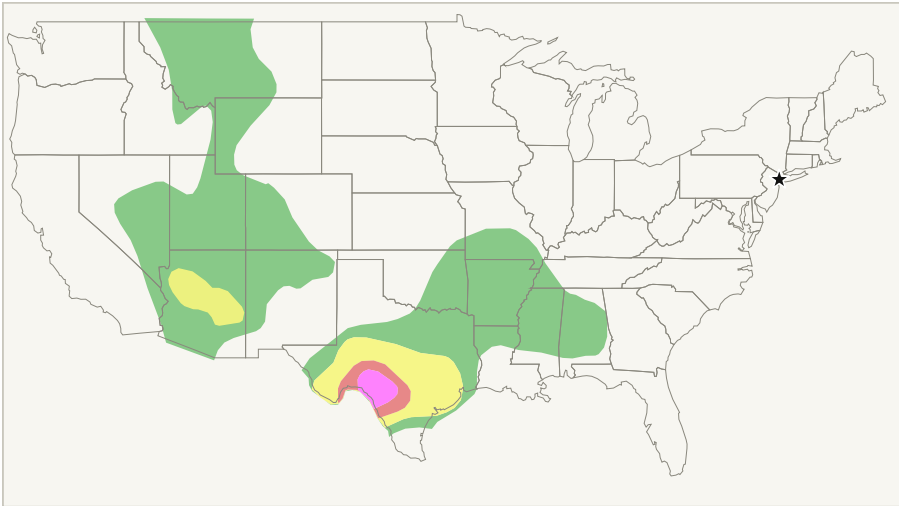

DAY 3 DISCUSSION — SPC REGIONAL (verbatim excerpt)

Enhanced mid-level flow will persist across the Pacific Northwest and the Great Lakes/Northeast US along the periphery of a large mid-level anticyclone centered across the central US. Across the Northwest, strong southwesterly mid-level flow and embedded vorticity/speed maxima will contribute to shower and thunderstorm ...

Excessive Rainfall Outlook — WPC

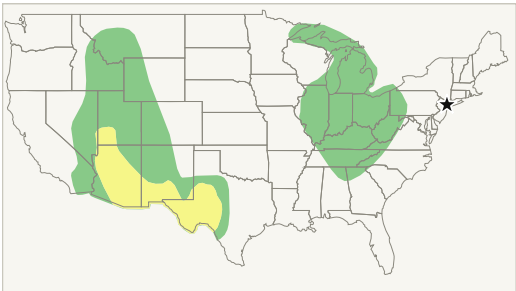

DAY 1 — TODAY (Jul 15)

DAY 2 — TOMORROW (Jul 16)

NYC: No excessive rainfall risk

DAY 3 — FRIDAY (Jul 17)

NYC: No excessive rainfall risk

LEGEND — OFFICIAL NWS DEFINITIONS • Chance of rainfall exceeding flash flood guidance within 25 miles of a point:

MRGL	Marginal — at least a 5% chance	SLGT	Slight — at least a 15% chance
MDT	Moderate — at least a 40% chance	HIGH	High — at least a 70% chance

DAY 1 DISCUSSION — WPC EXCESSIVE RAIN (verbatim excerpt)

Current satellite and radar composite depict a defined low to mid-level circulation situated over the Edwards Plateau into the neighboring Hill Country along and north of US90 to the west of San Antonio. Heavy rainfall continues within the confines of the disturbance with rainfall rates generally between 2-3"/hr in the stronger cores nestled within the meandering complex. Recent CAMs have been struggling ...

DAY 2 DISCUSSION — WPC EXCESSIVE RAIN (verbatim excerpt)

Convection will continue across the Edwards Plateau and surrounds for at least one more period as the regional pattern maintains a persistence in its evolution with yet another round of convection lingering through the morning from the previous period, and one last round of nocturnal convection anticipated the evening of ...

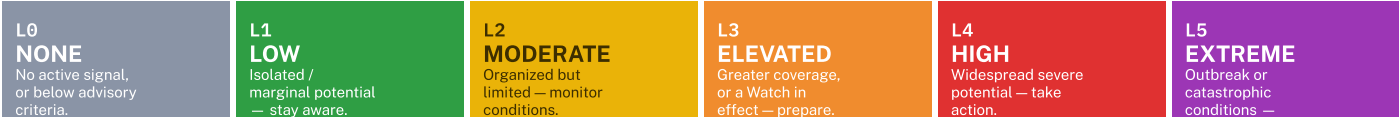

DAY 3 DISCUSSION — WPC EXCESSIVE RAIN (verbatim excerpt)

...THERE IS A MARGINAL RISK OF EXCESSIVE RAINFALL ACROSS PORTIONS OF THE WEST ON SATURDAY AND SUNDAY, AND OVER THE OHIO VALLEY INTO SOUTHERN NEW ENGLAND ON SATURDAY...

Source: NWS Weather Prediction Center Excessive Rainfall Outlook, rendered from WPC's official shapefiles (EXCESSIVERAIN_Day1-3_latest) with WPC's official risk categories; the star marks NYC; the chip is computed from the official polygons. Discussions relayed verbatim (QPFERD). No NYCEM forecast judgment.

HOW TO READ THIS BRIEFING

- Level badge

The solid colored badge is NYCEM's synthesized hazard level — the single takeaway.
- Category chip

Mono chips (MRGL, SLGT...) are the verbatim NWS / SPC / WPC category, colored by its mapped level.
- Two QPF bars

Each borough shows observed (hollow) last-24h rain and the next-24h forecast (filled); the tick is the borough max.
- Dashed lines

Notable >=0.5" and Heavy >=1" are reference thresholds — bars crossing them warrant attention.
- Worst-first

Hazards are ordered by level, highest first, so the most important items read first.
- Marker

Above, the ringed step is where today's value falls — it can differ from the page-1 level for multi-day peaks.
- Outlook pages

The SPC / WPC pages relay the national Days 1-3 maps in the agencies' official colors — the thin strips above decode them; the star on each map marks NYC.
